WAVE
DROWNING PREVENTION SYSTEMS

Even though our facility has dedicated and vigilant staff watching over the welfare of those in water, the risk of drowning is always present.

To dramatically reduce that risk, we are introducing an innovative new technology designed to support the efforts of our aquatics staff.

HOW WAVE WORKS.

WAVE operates in the background while lifeguards watch over their swimmers, just as they always do.

The system monitors swimmers in real time and accurately determines how long each swimmer's face is fully submerged and therefore unable to breathe.

If any swimmer has been underwater for a dangerous period of time, WAVE immediately alerts the aquatic staff so they can investigate and quickly intervene if needed.

MEET THE WAVE WEARABLES.

Each swimmer is provided with a wearable. They have a choice of either a comfortable headset called a Tracker, or a simple pair of clips that attach to most styles of goggles.

Trackers are very easy and comfortable to wear. They've been tested on 1000s of swimmers and most forget that they're wearing them after just a few minutes.

WAVE wearables have no buttons, and automatically activate when worn.

After use your swimmers simply return their wearables to the storage tower where they got them from.

WHAT DO I NEED TO DO?

For WAVE to be truly effective it's very important that you make sure your swimmers use wearables while in the water*.

You can help them understand that WAVE is there to make swimming as safe as it can be. They'll follow your lead and will quickly discover that using the wearables will become as ordinary as wearing a helmet while riding a bike.

With your support, WAVE will make your swimmers' time in the water as enjoyable as it's always been, but much safer.

WHAT IF I HAVE QUESTIONS?
